CHƯƠNG 1

LED Animations

1 Introduction

In this manual, the STM32CubeIDE is used as an editor to program the ARM microcontroller. STM32CubeIDE is an advanced C/C++ development platform with peripheral configuration, code generation, code compilation, and debug features for STM32 microcontrollers and microprocessors.

Hình 1.1: STM32Cube IDE for STM32 Programming

The most interest of STM32CubeIDE is that after the selection of an empty STM32 MCU or MPU, or preconfigured microcontroller or microprocessor from the selection of a board, the initialization code generated automatically. At any time during the development, the user can return to the initialization and configuration of the peripherals or middleware and regenerate the initialization code with no impact on the user code. This feature can simplify the initialization process and speedup the development application running on STM32 micro-controller. The software can be downloaded from the link bellow:

https://ubc.sgp1.digitaloceanspaces.com/BKU_Softwares/STM32/stm32cubeide_1.7.0.zip

Moreover, for a hangout class, the program is firstly simulated on Proteus. Students are also supposed to download and install this software as well:

https://ubc.sgp1.digitaloceanspaces.com/BKU_Softwares/STM32/Proteus_8.10_SP0_Pro.exe

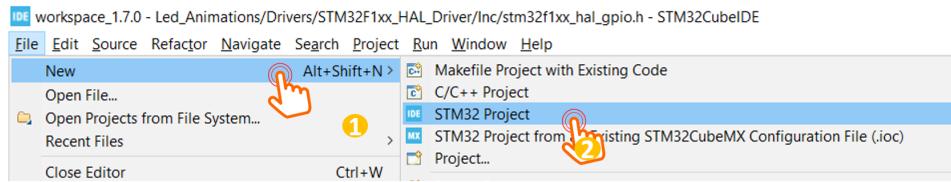

The rest of this manual consists of:

- Create a project on STM32Cube IDE
- Create a project on Proteus
- Simulate the project on Proteus

Finally, students are supposed to finish 10 different projects.

2 First project on STM32Cube

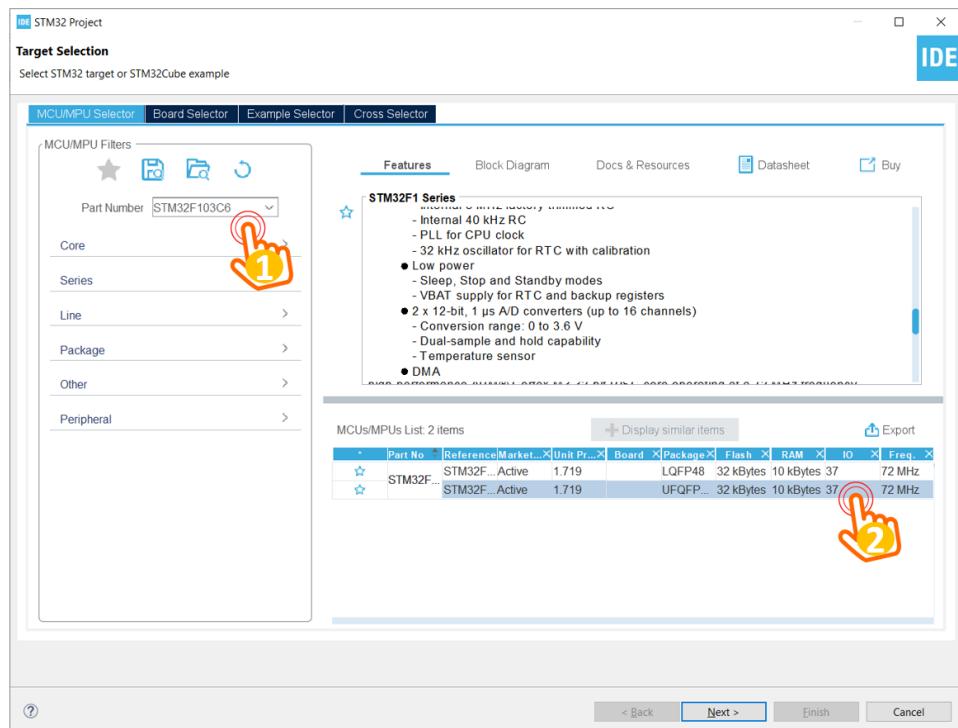

Step 1: Launch STM32CubeIDE, from the menu **File**, select **New**, then chose **STM32 Project**

Hình 1.2: Create a new project on STM32CubeIDE

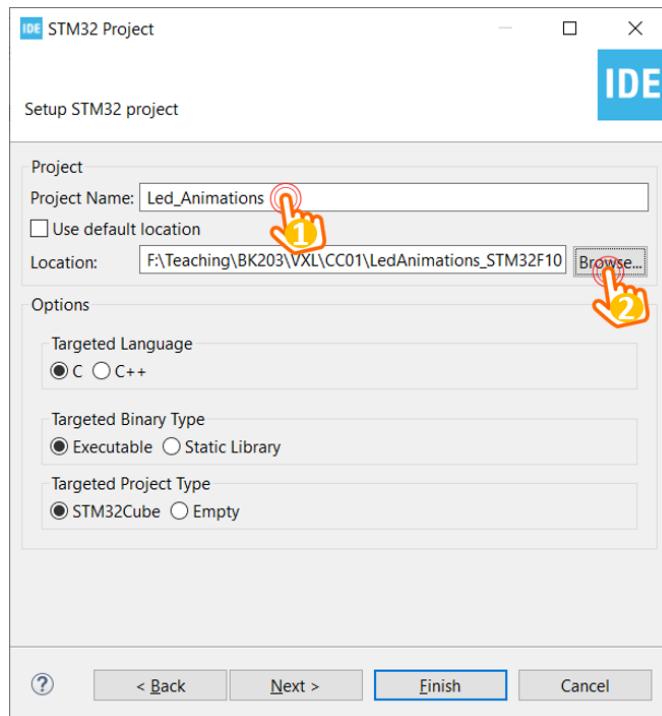

The IDE needs to download some packages, which normally takes time in this first time a project is created.

Step 2: Select the STM32F103C6 in the following dialog, then click on **Next**

Hình 1.3: Select the target device

Step 3: Provide the **Name** and the **Location** for the project.

Hình 1.4: Select the target device

It is important to notice that the **Targeted Project Type** should be **STM32Cube**. In the case this option is disable, step 1 must be repeated. The location path should not contain special characters (e.g. the space). Finally, click on the **Next** button.

Step 4: On the last dialog, just keep the default firmware version and click on **Finish** button.

Step 5: The project is created and the wizard for configuration is display. This utility from CubeIDE can simplify the configuration process for an ARM micro-controller like the STM32.

From the configuration windows, select **Pin configuration**, select the pin **PA5** and set to **GPIO Output** mode, since this pin is connected to an LED in the STM32 development kit.

Step 6: Right click on PA5 and select **Enter user label**, and provide the name for this pin (e.g. **LED_RED**). This step helps programming afterward more memorable.

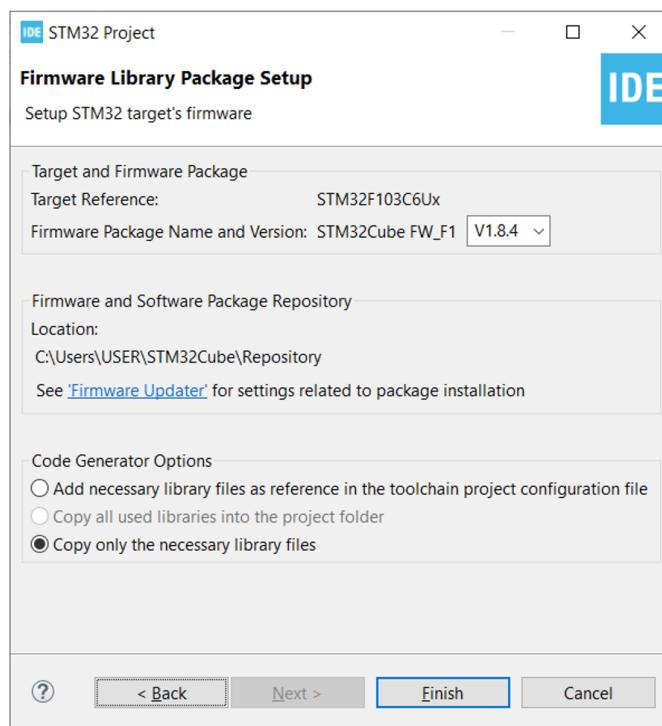

Finally, save the configuration process by pressing **Ctrl + S** and confirm this step by clicking on **OK** button. The code generation is started.

Step 7: Implement the first blinky project in the main function as follow:

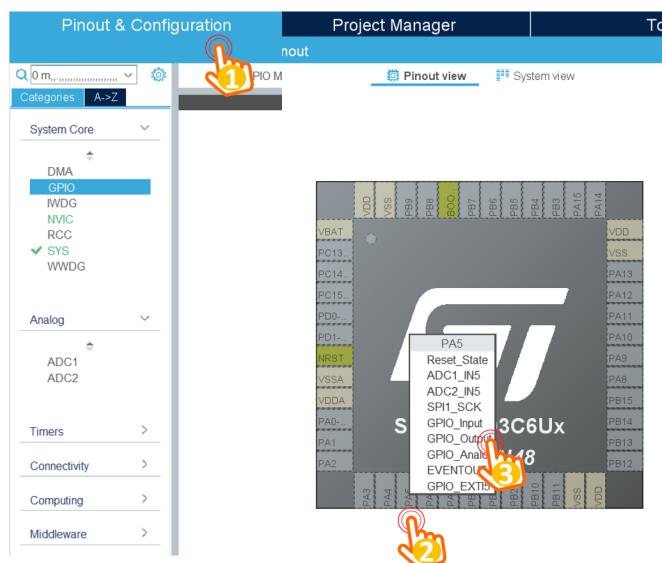

```

1 int main(void)
2 {
3     /* USER CODE BEGIN 1 */
4
5     /* USER CODE END 1 */

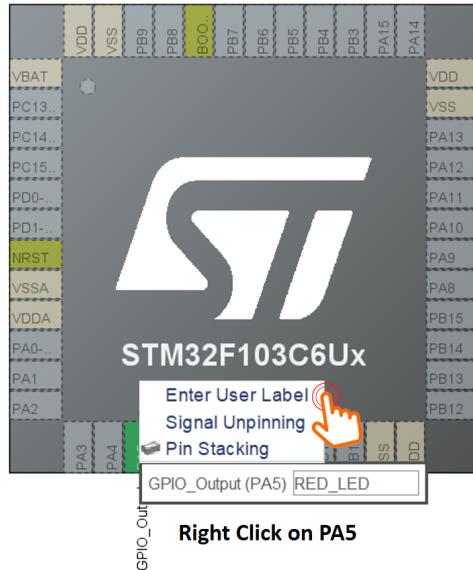

```

Hình 1.5: Keep default firmware version

Hình 1.6: Set PA5 to GPIO Output mode

Hình 1.7: Provide a name for PA5

```

6  /* MCU Configuration
7  -----
8
9  /* Reset of all peripherals, Initializes the Flash
   interface and the Systick. */
10 HAL_Init();
11
12 /* USER CODE BEGIN Init */
13
14 /* USER CODE END Init */
15
16 /* Configure the system clock */
17 SystemClock_Config();
18
19 /* USER CODE BEGIN SysInit */
20
21 /* USER CODE END SysInit */
22
23 /* Initialize all configured peripherals */
24 MX_GPIO_Init();
25 /* USER CODE BEGIN 2 */
26
27 /* USER CODE END 2 */
28
29 /* Infinite loop */
30 /* USER CODE BEGIN WHILE */
31
32 while (1)
33 {

```

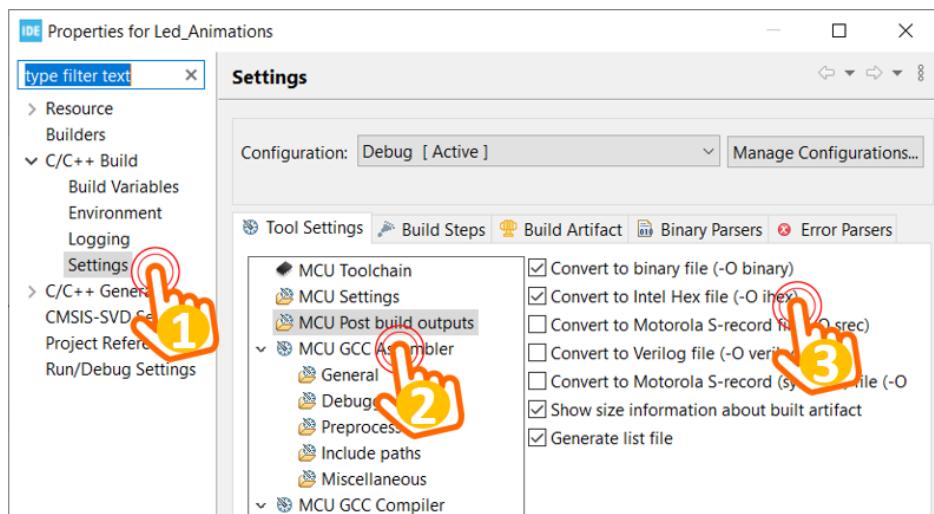

```

34     HAL_GPIO_TogglePin(LED_RED_GPIO_Port, LED_RED_Pin);
35     HAL_Delay(1000);
36     /* USER CODE END WHILE */
37
38     /* USER CODE BEGIN 3 */
39 }
40 /* USER CODE END 3 */
41 }
```

Program 1.1: First blinky LED project

Actually, what is added to the main function is line number 34 and 35. Please put your code in a right place, otherwise it can be deleted when the code is generated (e.g. change the configuration of the project). When coding, frequently use the suggestions by pressing **Ctrl+Space**.

Step 7: Due to the simulation on Proteus, the hex file should be generated from STM32Cube IDE. From menu **Project**, select **Properties** to open the dialog bellow:

Hình 1.8: Config for hex file output

Navigate to **C/C++ Build**, select **Settings**, **MCU Post build outputs**, and check to the **Intel Hex file**.

Step 8: Build the project by clicking on menu **Project** and select **Build Project**. Please check on the output console of the IDE to be sure that the hex file is generated, as follow:

```

22:36:06 **** Incremental Build of configuration Debug for project Led_Animations ****
make -j8 all
arm-none-eabi-size  Led_Animations.elf
      text    data     bss     dec   hex filename
      4596      20    1572    6188   182c Led_Animations.elf
Finished building: default.size.stdout

22:36:06 Build Finished. 0 errors, 0 warnings. (took 272ms)
```

Hình 1.9: Compile the project and generate Hex file

The hex file is located under the **Debug** folder of your project, which is used for the simulation in Proteus afterward. In the case a development kit is connected to your PC, from menu **Run**, select **Run** to download the program to the hardware platform.

In the case there are multiple project in a work-space, double click on the project name to activate this project. Whenever a project is built, check the output files to make sure that you are working in a right project.

3 Simulation on Proteus

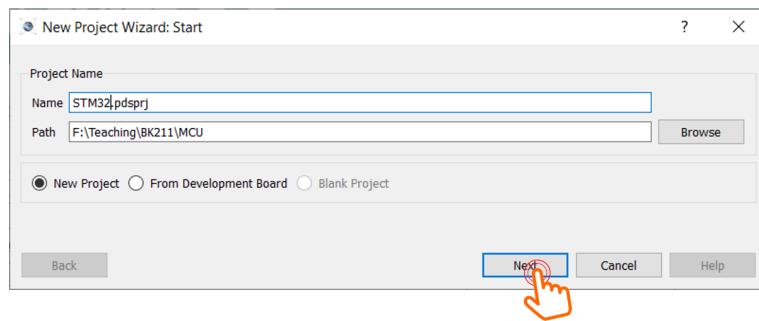

For an online training, a simulation on Proteus can be used. The details to create an STM32 project on Proteus are described below.

Step 1: Launch Proteus (**with administration access**) and from menu **File**, select **New Project**.

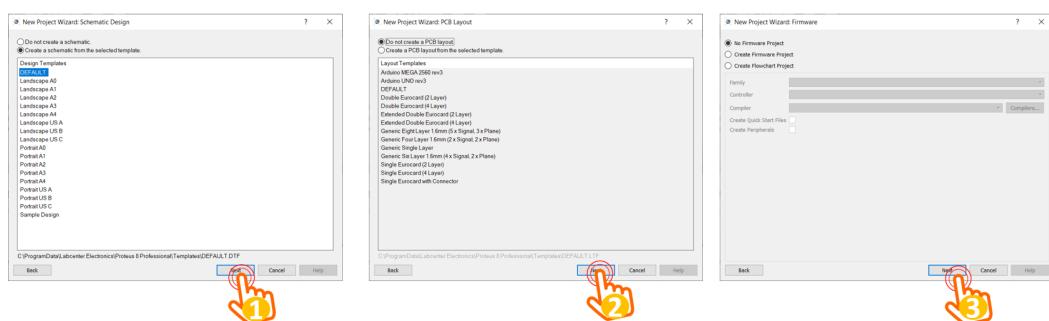

Hình 1.10: Create a new project on Proteus

Step 2: Provide the name and the location of the project, then click on **Next** button.

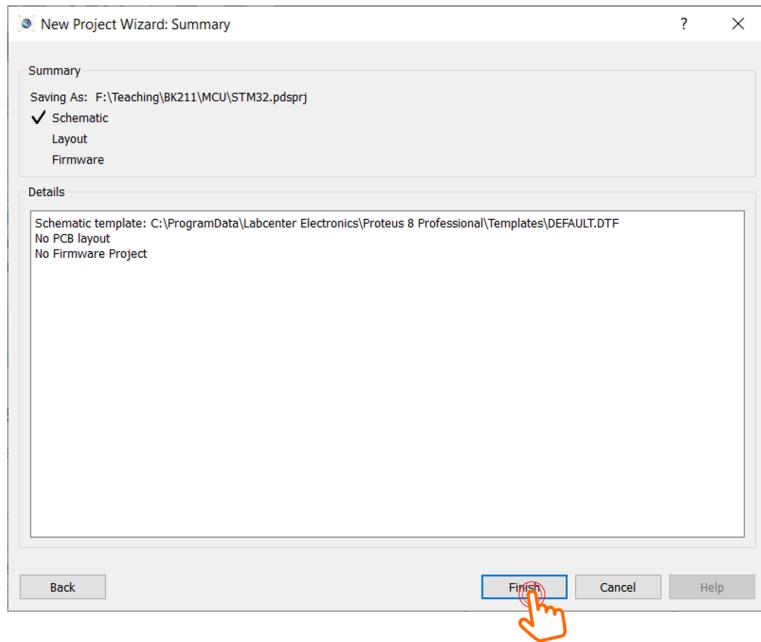

Hình 1.11: Provide project name and location

Step 3: For following dialog, just click on **Next** button as just a schematic is required for the lab.

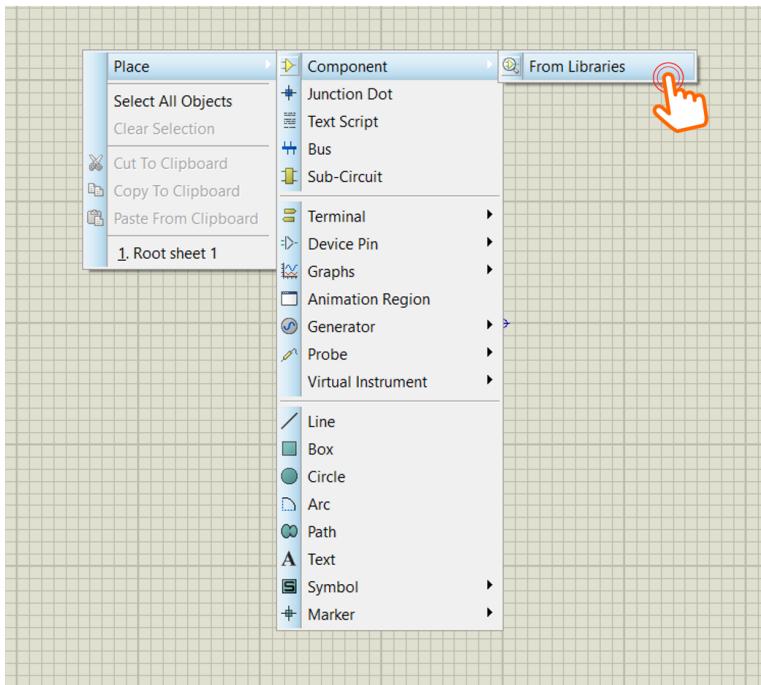

Hình 1.12: Keep the default options by clicking on Next

Step 4: Finally, click on **Finish** button to close the project wizard.

Hình 1.13: Finish the project wizard

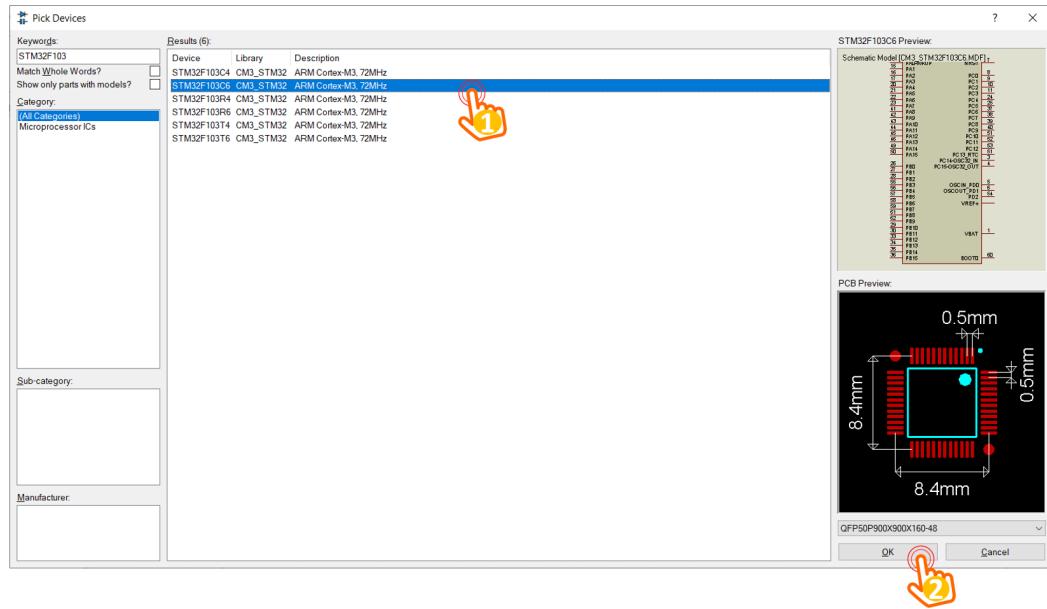

Step 5: On the main page of the project, right click to select **Place, Components, From Libraries**, as follows:

Hình 1.14: Select a component from the library

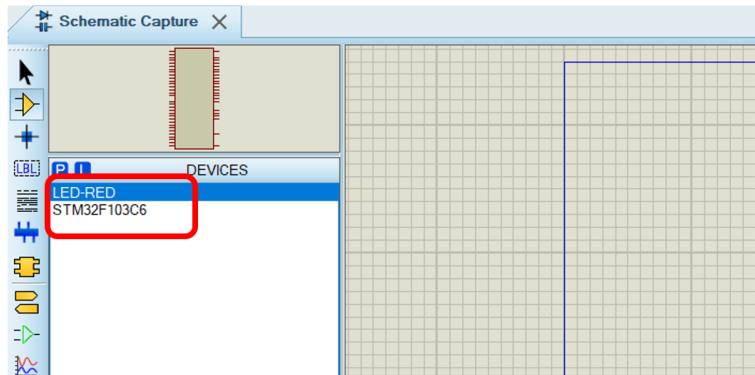

If there is an error with no library found, please restart the Proteus software with Run as administrator option.

Step 6: From the list of components in the library, select STM32F103C6, as follows:

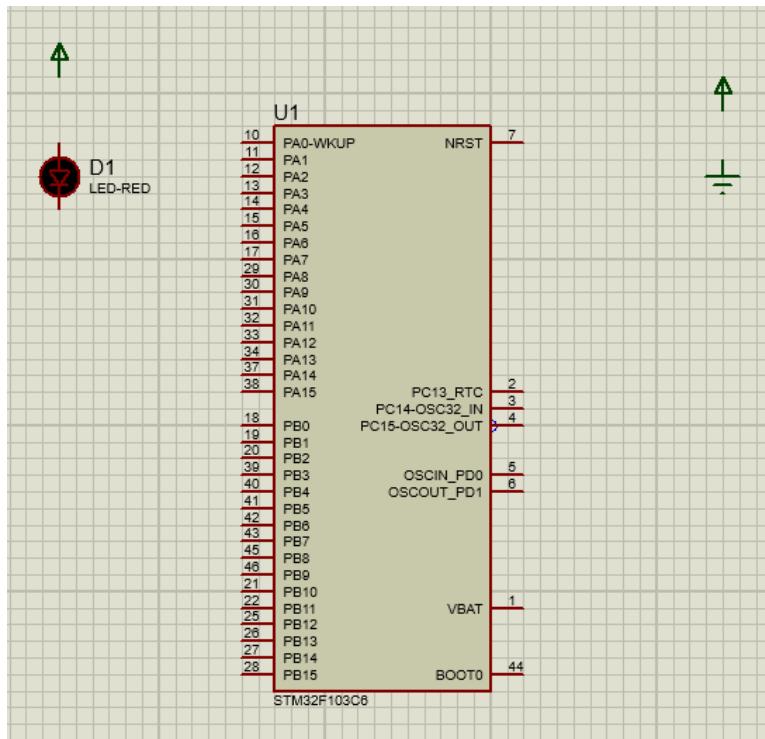

Hình 1.15: Select STM32F103C6

Repeat step 5 and 6 to select an LED, named **LED-RED** in Proteus. Finally, these components are appeared on the **DEVICES** windows, which is on left hand side as follows:

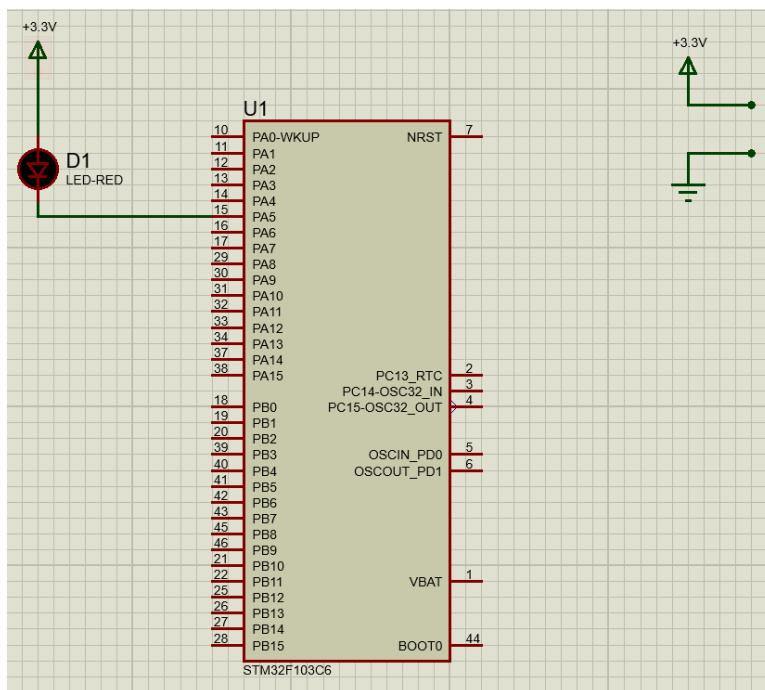

Hình 1.16: STM32 and an LED in the project

Step 7: Place the components to the project: right click on the main page, select on **Place, Component**, and select device added in Step 6. To add the Power and the Ground, right click on the main page, select on **Place, Terminal**. The result in this step is expected as follows:

Hình 1.17: Place components to the project

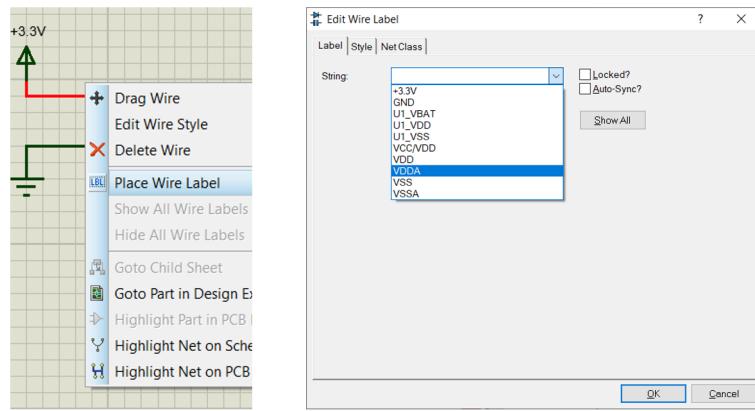

Step 8: Start wiring the circuit. The negative pin of the LED is connected to PA5 while its positive pin is connected to the power supply. For the power and the ground on the right, just make a short wire, which will be labeled in the next step.

Hình 1.18: Connect components and set the power to 3.3V

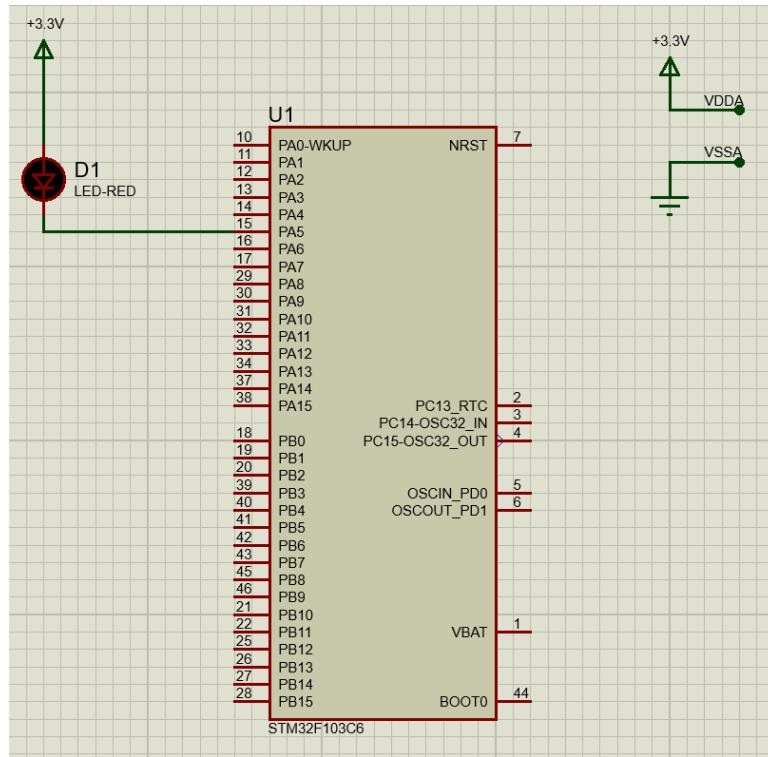

In this step, also double click on the power supply in order to provide the String property to **+3.3V**.

Step 8: Right click on the wire of the power supply and the ground, and select Place wire Label

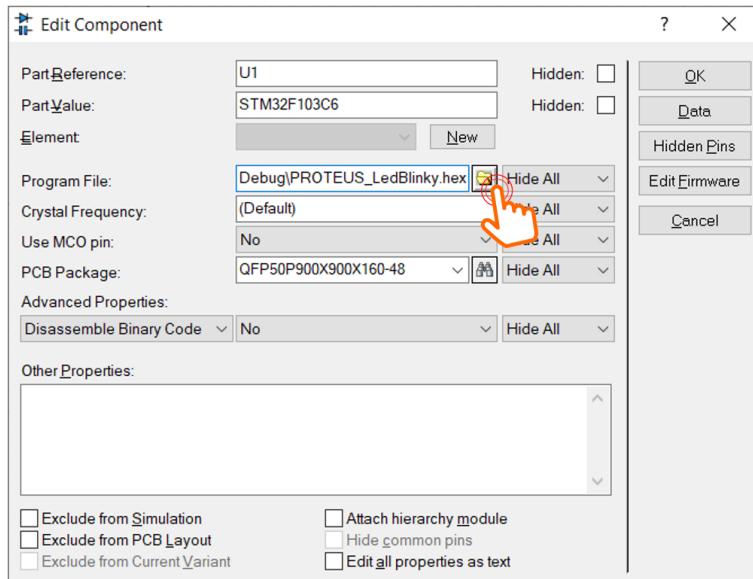

Hình 1.19: Place label for Power and Ground

This step is required as VDDA and VSSA of the STM32 must be connected to provide the reference voltage. Therefore, VDDA is connected to 3.3V, while the VSSA is connected to the Ground. Finally, the image of our schematic is shown bellow:

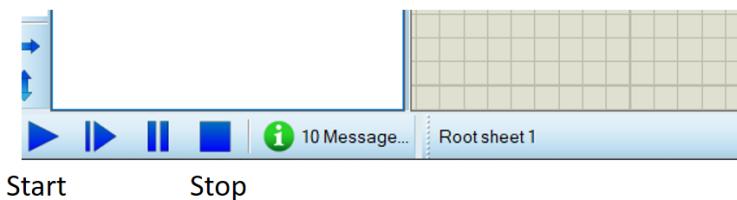

Hình 1.20: Finalize the schematic

Step 9: Double click on the STM32, and set the **Program File** to the Hex file, which is generated from Cube IDE, as following:

Hình 1.21: Set the program of the STM32 to the hex file from Cube IDE

From now, the simulation is ready to start by clicking on the menu **Debug**, and select on **Run simulation**. To stop the simulation, click on **Debug** and select **Stop VMS Debugging**. Moreover, there are some quick access bottom on the left corner of the Proteus to start or stop the simulation, as shown following:

Hình 1.22: Quick access buttons to start and stop the simulation

If everything is success, students can see the LED is blinking every second. Please stop the simulation before updating the project, either in Proteus or STM32Cube IDE. However, the step 9 (set the program file for STM32 in Proteus) is required to do once. Beside the toggle instruction, student can set or reset a pin as following:

```

1 while (1){
2     HAL_GPIO_WritePin(LED_RED_GPIO_Port , LED_RED_Pin ,
3         GPIO_PIN_SET);
4     HAL_Delay(1000);
5     HAL_GPIO_WritePin(LED_RED_GPIO_Port , LED_RED_Pin ,
6         GPIO_PIN_RESET);
7     HAL_Delay(1000);
8 }
```

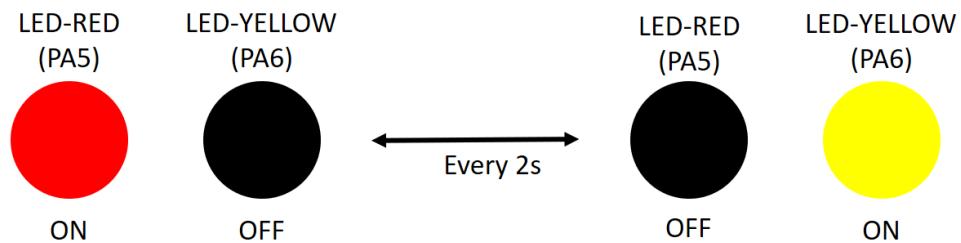

Program 1.2: An example for LED blinky

4 Exercise and Report

4.1 Exercise 1

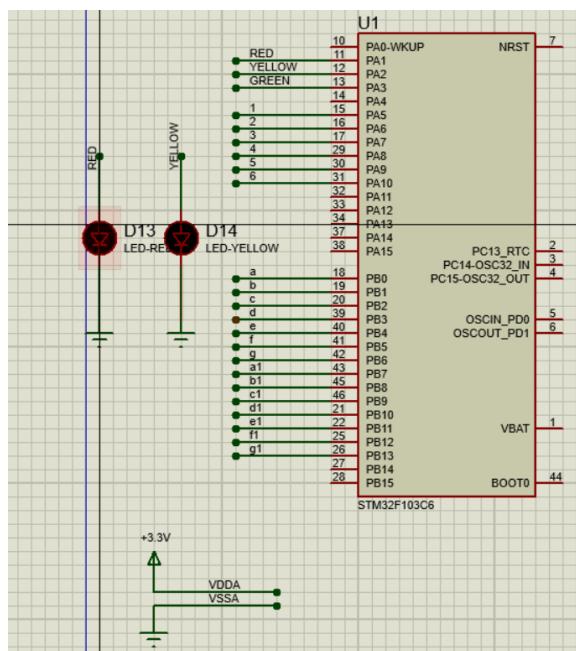

From the simulation on Proteus, one more LED is connected to pin **PA6** of the STM32 (negative pin of the LED is connected to PA6). The component suggested in this exercise is **LED-YELLOW**, which can be found from the device list.

In this exercise, the status of two LEDs are switched every 2 seconds, as demonstrated in the figure bellow.

Hình 1.23: State transitions for 2 LEDs

Report 1: Depict the schematic from Proteus simulation in this report. The caption of the figure is a downloadable link to the Proteus project file (e.g. a github link).

Hình 1.24: Sơ đồ mạch Exercise 1

Report 2: Present the source code in the infinite loop while of your project. If a user-defined functions is used, it is required to present in this part. A brief description can be added for this function (e.g. using comments). A template to present your source code is presented bellow.

```

1 while (1){
2     HAL_GPIO_TogglePin(GPIOA, GPIO_PIN_5);
3     HAL_Delay(1000);
4 }
```

Program 1.3: An example for your source code

Source code Exercise 1:

```

1 void ex1_run(void){
2     static int led_status = 0;
3     static int count = 0;
4     count++;
5     switch(led_status){
6         case 0:
7             HAL_GPIO_WritePin(LED_R_GPIO_Port,
8                 LED_R_Pin, GPIO_PIN_SET);
9             HAL_GPIO_WritePin(LED_Y_GPIO_Port,
10                LED_Y_Pin, GPIO_PIN_RESET);
11             if(count >= 2){
12                 led_status = 1;
13                 count = 0;
14             }
15             break;
16         case 1:
17             HAL_GPIO_WritePin(LED_R_GPIO_Port,
18                 LED_R_Pin, GPIO_PIN_RESET);
19             HAL_GPIO_WritePin(LED_Y_GPIO_Port,
20                 LED_Y_Pin, GPIO_PIN_SET);
21             if(count >= 2){
22                 led_status = 0;
23                 count = 0;
24             }
25             break;
26     }
27 }
```

Program 1.4: Hàm ex1_run()

```

1 while (1){
2     ex1_run();
3     HAL_Delay(1000);
4 }
```

Program 1.5: Đoạn mã trong while(1)

Hàm ex1_run() là một máy trạng thái điều khiển việc thay đổi trạng thái của hai LED (ĐỎ và VÀNG) dựa trên bộ đếm. Mỗi lần hàm được gọi, bộ đếm (count) tăng lên. Khi bộ đếm đạt giá trị 2, trạng thái của LED sẽ chuyển đổi:

- Nếu LED ĐỎ đang bật và LED VÀNG tắt (trạng thái 0), hàm sẽ chuyển sang bật LED VÀNG và tắt LED ĐỎ (trạng thái 1).

- Nếu LED VÀNG đang bật và LED ĐỎ tắt (trạng thái 1), hàm sẽ chuyển sang bật LED ĐỎ và tắt LED VÀNG (trạng thái 0).

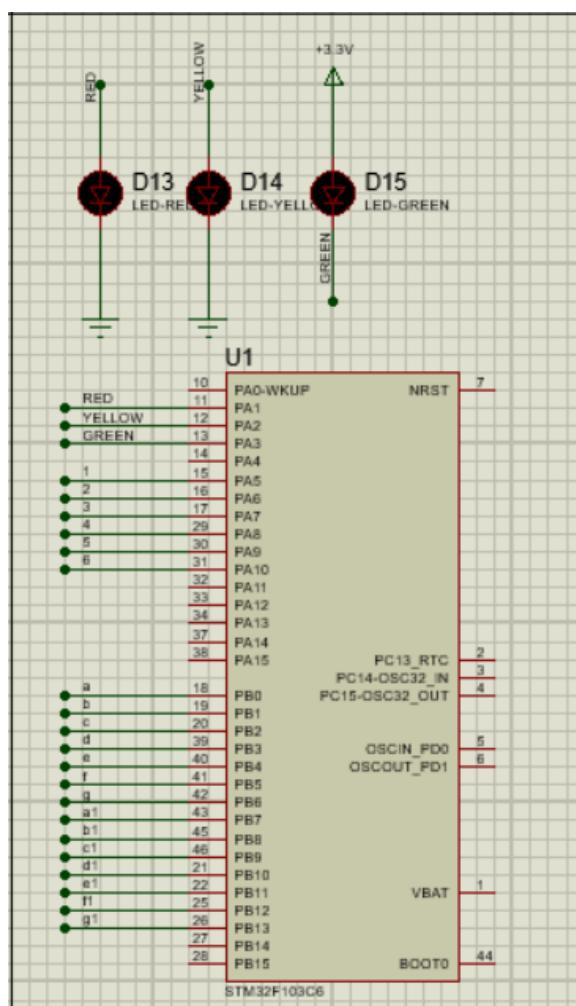

Sau mỗi lần chuyển đổi, bộ đếm được đặt lại về 0 để tiếp tục đếm cho chu kỳ tiếp theo.

4.2 Exercise 2

Extend the first exercise to simulate the behavior of a traffic light. A third LED, named **LED-GREEN** is added to the system, which is connected to **PA7**. A cycle in this traffic light is 5 seconds for the RED, 2 seconds for the YELLOW and 3 seconds for the GREEN. The LED-GREEN is also controlled by its negative pin.

Similarly, the report in this exercise includes the schematic of your circuit and a your source code in the while loop.

Report 1: Present the schematic.

Hình 1.25: Sơ đồ mạch exercise 2

Report 2: Present the source code in while. Source code Exercise 2:

```

1 void ex2_run(void){
2     static int led_status = 0;
3     static int count = 0;
4     count++;
5     switch(led_status){
6         case 0:
7             HAL_GPIO_WritePin(LED_R_GPIO_Port,
8                 LED_R_Pin, GPIO_PIN_SET);
9                 HAL_GPIO_WritePin(LED_Y_GPIO_Port,
10                LED_Y_Pin, GPIO_PIN_RESET);
11                HAL_GPIO_WritePin(LED_GR_GPIO_Port,
12                LED_GR_Pin, GPIO_PIN_SET);
13                if(count >= 5){
14                    led_status = 1;
15                    count = 0;
16                }
17                break;
18        case 1:
19            HAL_GPIO_WritePin(LED_R_GPIO_Port,
20                LED_R_Pin, GPIO_PIN_RESET);
21                HAL_GPIO_WritePin(LED_Y_GPIO_Port,
22                LED_Y_Pin, GPIO_PIN_SET);
23                HAL_GPIO_WritePin(LED_GR_GPIO_Port,
24                LED_GR_Pin, GPIO_PIN_SET);
25                if(count >= 2){
26                    led_status = 2;
27                    count = 0;
28                }
29                break;
30        case 2:
31            HAL_GPIO_WritePin(LED_R_GPIO_Port, LED_R_Pin,
32                GPIO_PIN_RESET);
33            HAL_GPIO_WritePin(LED_Y_GPIO_Port, LED_Y_Pin,
34                GPIO_PIN_RESET);
35            HAL_GPIO_WritePin(LED_GR_GPIO_Port,
36                LED_GR_Pin, GPIO_PIN_RESET);
37            if(count >= 3){
38                led_status = 0;
39                count = 0;
40            }
41            break;
42    }
43 }

```

Program 1.6: Hàm ex2_run

```

1 while (1){
2     ex2_run();
3     HAL_Delay(1000);

```

Program 1.7: Đoạn mã trong while(1)

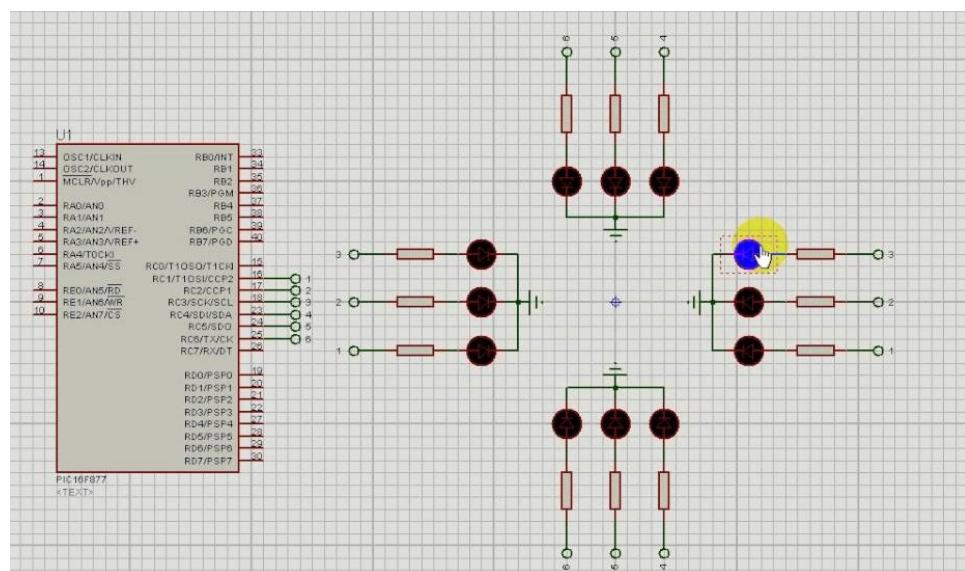

Hàm ex2_run() điều khiển trạng thái của ba LED (ĐỎ, VÀNG, và XANH LÁ) dựa trên một bộ đếm. Mỗi lần hàm được gọi, bộ đếm (count) tăng lên. Khi bộ đếm đạt giá trị nhất định, trạng thái của các LED sẽ thay đổi:

- **Trạng thái 0:** LED ĐỎ và LED XANH LÁ bật, LED VÀNG tắt. Khi bộ đếm đạt 5, chuyển sang trạng thái 1.
- **Trạng thái 1:** LED VÀNG bật, LED ĐỎ và LED XANH LÁ tắt. Khi bộ đếm đạt 2, chuyển sang trạng thái 2.
- **Trạng thái 2:** Tất cả LED tắt. Khi bộ đếm đạt 3, quay lại trạng thái 0.

Sau mỗi lần chuyển đổi trạng thái, bộ đếm được đặt lại về 0 để tiếp tục đếm cho chu kỳ tiếp theo.

4.3 Exercise 3

Extend to the 4-way traffic light. Arrange 12 LEDs in a nice shape to simulate the behaviors of a traffic light. A reference design can be found in the figure bellow.

Hình 1.26: Reference design for a 4 way traffic light

Source code Exercise 3:

```

1     void ex3_run(void){
2         static int led_status = 0;
3         static int count = 0;
4         count++;
5         switch(led_status){
6             case 0:

```

```

7         HAL_GPIO_WritePin(LED_RED_GPIO_Port ,
8             LED_RED_Pin , GPIO_PIN_SET);
9             HAL_GPIO_WritePin(LED_YELLOW_GPIO_Port ,
10            LED_YELLOW_Pin , GPIO_PIN_RESET);
11            HAL_GPIO_WritePin(LED_GREEN_GPIO_Port ,
12            LED_GREEN_Pin , GPIO_PIN_RESET);
13            HAL_GPIO_WritePin(LED_RED1_GPIO_Port ,
14            LED_RED1_Pin , GPIO_PIN_RESET);
15            HAL_GPIO_WritePin(LED_YELLOW1_GPIO_Port ,
16            LED_YELLOW1_Pin , GPIO_PIN_RESET);
17            HAL_GPIO_WritePin(LED_GREEN1_GPIO_Port ,
18            LED_GREEN1_Pin , GPIO_PIN_SET);
19            if(count >= 3 ){
20                led_status = 1;
21                count = 0;
22            }
23            break;
24        case 1:
25            HAL_GPIO_WritePin(LED_RED_GPIO_Port ,
26            LED_RED_Pin , GPIO_PIN_SET);
27            HAL_GPIO_WritePin(LED_YELLOW_GPIO_Port ,
28            LED_YELLOW_Pin , GPIO_PIN_RESET);
29            HAL_GPIO_WritePin(LED_GREEN_GPIO_Port ,
30            LED_GREEN_Pin , GPIO_PIN_RESET);
31            HAL_GPIO_WritePin(LED_RED1_GPIO_Port ,
32            LED_RED1_Pin , GPIO_PIN_RESET);
33            HAL_GPIO_WritePin(LED_YELLOW1_GPIO_Port ,
34            LED_YELLOW1_Pin , GPIO_PIN_SET);
35            HAL_GPIO_WritePin(LED_GREEN1_GPIO_Port ,
36            LED_GREEN1_Pin , GPIO_PIN_RESET);

37            if(count >= 2){
38                led_status = 2;
39                count = 0;
40            }
41            break;
42        case 2:
43            HAL_GPIO_WritePin(LED_RED_GPIO_Port ,
44            LED_RED_Pin , GPIO_PIN_RESET);
45            HAL_GPIO_WritePin(LED_YELLOW_GPIO_Port ,
46            LED_YELLOW_Pin , GPIO_PIN_RESET);
47            HAL_GPIO_WritePin(LED_GREEN_GPIO_Port ,
48            LED_GREEN_Pin , GPIO_PIN_SET);
49            HAL_GPIO_WritePin(LED_RED1_GPIO_Port ,
50            LED_RED1_Pin , GPIO_PIN_SET);
51            HAL_GPIO_WritePin(LED_YELLOW1_GPIO_Port ,
52            LED_YELLOW1_Pin , GPIO_PIN_RESET);
53            HAL_GPIO_WritePin(LED_GREEN1_GPIO_Port ,
54            LED_GREEN1_Pin , GPIO_PIN_RESET);

```

```

38         if(count >= 3){
39             led_status = 3;
40             count = 0;
41         }
42         break;
43     case 3:
44         HAL_GPIO_WritePin(LED_RED_GPIO_Port ,
45 LED_RED_Pin , GPIO_PIN_RESET);
46         HAL_GPIO_WritePin(LED_YELLOW_GPIO_Port ,
47 LED_YELLOW_Pin , GPIO_PIN_SET);
48         HAL_GPIO_WritePin(LED_GREEN_GPIO_Port ,
49 LED_GREEN_Pin , GPIO_PIN_RESET);
50         HAL_GPIO_WritePin(LED_RED1_GPIO_Port ,
51 LED_RED1_Pin , GPIO_PIN_SET);
52         HAL_GPIO_WritePin(LED_YELLOW1_GPIO_Port ,
53 LED_YELLOW1_Pin , GPIO_PIN_RESET);
54         HAL_GPIO_WritePin(LED_GREEN1_GPIO_Port ,
55 LED_GREEN1_Pin , GPIO_PIN_RESET);
56         if(count >= 2){
57             led_status = 0;
58             count = 0;
59         }
60         break;
61     }
62 }

```

Hàm ex3_run() điều khiển trạng thái của sáu LED (ĐỎ, VÀNG, XANH LÁ trên hai bộ LED) dựa trên một bộ đếm. Mỗi lần hàm được gọi, bộ đếm (count) tăng lên. Khi bộ đếm đạt giá trị nhất định, trạng thái của các LED sẽ thay đổi như sau:

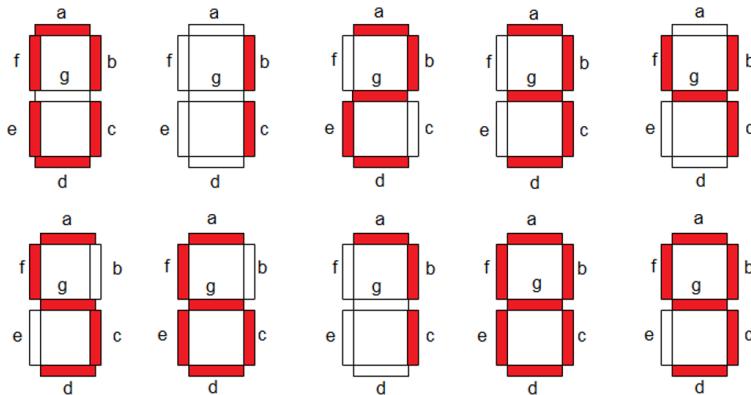

- **Trạng thái 0:** LED ĐỎ bật, LED XANH LÁ và LED VÀNG tắt. Trạng thái của LED ĐỎ1 là tắt, LED XANH LÁ1 bật. Khi bộ đếm đạt 3, chuyển sang trạng thái 1.
- **Trạng thái 1:** LED ĐỎ bật, LED VÀNG bật, LED XANH LÁ tắt. LED ĐỎ1 tắt, LED VÀNG1 bật, LED XANH LÁ1 tắt. Khi bộ đếm đạt 2, chuyển sang trạng thái 2.
- **Trạng thái 2:** LED XANH LÁ bật, LED ĐỎ và LED VÀNG tắt. LED ĐỎ1 bật, LED VÀNG1 tắt, LED XANH LÁ1 tắt. Khi bộ đếm đạt 3, chuyển sang trạng thái 3.
- **Trạng thái 3:** LED VÀNG bật, LED ĐỎ và LED XANH LÁ tắt. LED ĐỎ1 bật, LED VÀNG1 tắt, LED XANH LÁ1 tắt. Khi bộ đếm đạt 2, quay lại trạng thái 0.

Sau mỗi lần chuyển đổi trạng thái, bộ đếm được đặt lại về 0 để tiếp tục đếm cho chu kỳ tiếp theo.

4.4 Exercise 4

Add **only one 7 led segment** to the schematic in Exercise 3. This component can be found in Proteus by the keyword **7SEG-COM-ANODE**. For this device, the common pin should be connected to the power supply and other pins are supposed to be connected to PB0 to PB6. Therefore, to turn-on a segment in this 7SEG, the STM32 pin should be in logic 0 (0V).

Implement a function named **display7SEG(int num)**. The input for this function is from 0 to 9 and the outputs are listed as following:

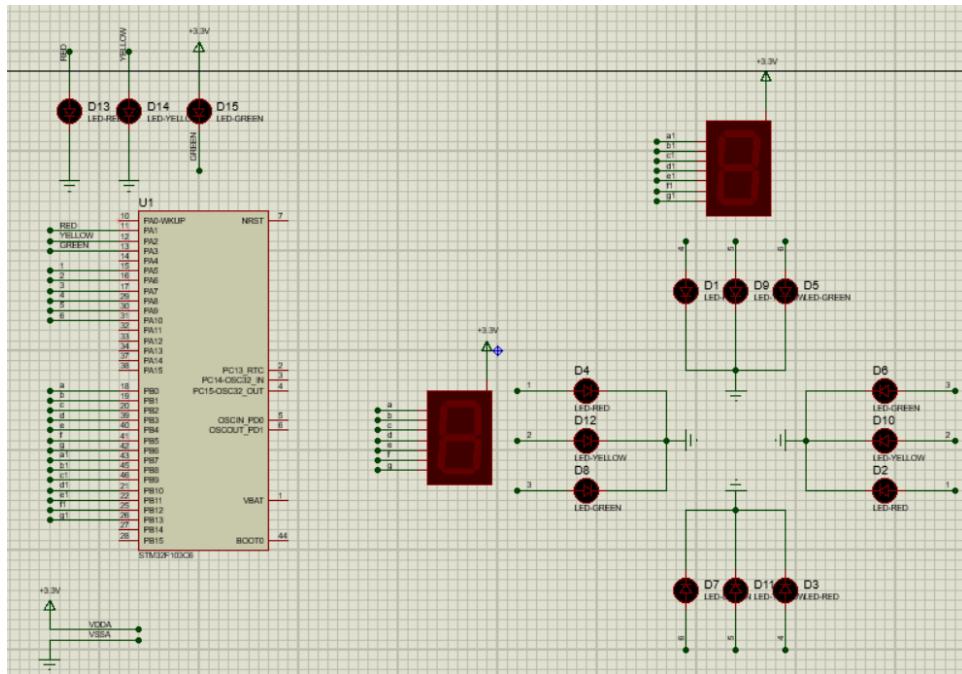

Hình 1.27: Display a number on 7 segment LED

This function is invoked in the while loop for testing as following:

```
1 int counter = 0;
2 while (1){
3     if(counter >= 10) counter = 0;
4     display7SEG(counter++);
5     HAL_Delay(1000);
6 }
7 }
```

Program 1.8: An example for your source code

Report 1: Present the schematic.

Hình 1.28: Sơ đồ mạch ex4

Report 2: Present the source code for display7SEG function.

Source code Exercise 4:

```
1 void display7SEG(int num){  
2  
3     switch(num){  
4         case 0:  
5             HAL_GPIO_WritePin(LED_A_GPIO_Port, LED_A_Pin,  
6 GPIO_PIN_RESET);  
7             HAL_GPIO_WritePin(LED_B_GPIO_Port, LED_B_Pin,  
8 GPIO_PIN_RESET);  
9             HAL_GPIO_WritePin(LED_C_GPIO_Port, LED_C_Pin,  
10 GPIO_PIN_RESET);  
11            HAL_GPIO_WritePin(LED_D_GPIO_Port, LED_D_Pin,  
12 GPIO_PIN_RESET);  
13            HAL_GPIO_WritePin(LED_E_GPIO_Port, LED_E_Pin,  
14 GPIO_PIN_RESET);  
15            HAL_GPIO_WritePin(LED_F_GPIO_Port, LED_F_Pin,  
16 GPIO_PIN_RESET);  
17            HAL_GPIO_WritePin(LED_G_GPIO_Port, LED_G_Pin,  
18 GPIO_PIN_SET);  
19            break;  
20        case 1:  
21            HAL_GPIO_WritePin(LED_A_GPIO_Port, LED_A_Pin,  
22 GPIO_PIN_SET);  
23            HAL_GPIO_WritePin(LED_B_GPIO_Port, LED_B_Pin,  
24 GPIO_PIN_RESET);
```

```

16     HAL_GPIO_WritePin(LED_C_GPIO_Port , LED_C_Pin ,
17     GPIO_PIN_RESET);
18     HAL_GPIO_WritePin(LED_D_GPIO_Port , LED_D_Pin ,

91     HAL_GPIO_WritePin(LED_F_GPIO_Port , LED_F_Pin ,
92     GPIO_PIN_RESET);
93     HAL_GPIO_WritePin(LED_G_GPIO_Port , LED_G_Pin ,
94     GPIO_PIN_RESET);
95     break;
}
}

```

Hàm `display7SEG(int num)` điều khiển hiển thị số trên màn hình 7 đoạn. Hàm nhận vào một tham số num (từ 0 đến 9) và thực hiện bật/tắt các chân GPIO tương ứng với các đoạn LED trên màn hình để hiển thị số tương ứng.

Cụ thể, hàm sẽ thực hiện thao tác sau cho mỗi số từ 0 đến 9:

- Mỗi số được hiển thị bằng cách bật hoặc tắt các đoạn LED (LED_A, LED_B, LED_C, LED_D, LED_E, LED_F, LED_G) để tạo thành hình dạng của số đó.
- Ví dụ: Để hiển thị số 0, tất cả các đoạn LED trừ LED_G sẽ được bật.
- Cứ mỗi số từ 0 đến 9, hàm sẽ thao tác tương ứng với các đoạn LED để tạo thành số cần hiển thị.

4.5 Exercise 5

Integrate the 7SEG-LED to the 4 way traffic light. In this case, the 7SEG-LED is used to display countdown value.

In this exercise, only source code is required to present. The function display7SEG in previous exercise can be re-used.

Source code Exercise 5:

```

1      void ex5_run(void){
2          static int led_status = 0;
3          static int count = 0;
4          static int count1 = 0;
5          count++;
6          count1++;
7          switch(led_status){
8              case 0:
9                  HAL_GPIO_WritePin(LED_RED_GPIO_Port ,
10                     LED_RED_Pin , GPIO_PIN_SET);
11                  HAL_GPIO_WritePin(LED_YELLOW_GPIO_Port ,
12                     LED_YELLOW_Pin , GPIO_PIN_RESET);
13                  HAL_GPIO_WritePin(LED_GREEN_GPIO_Port ,
14                     LED_GREEN_Pin , GPIO_PIN_RESET);
15                  HAL_GPIO_WritePin(LED_RED1_GPIO_Port ,
16                     LED_RED1_Pin , GPIO_PIN_RESET);
17                  HAL_GPIO_WritePin(LED_YELLOW1_GPIO_Port ,
18                     LED_YELLOW1_Pin , GPIO_PIN_RESET);
19                  HAL_GPIO_WritePin(LED_GREEN1_GPIO_Port ,
20                     LED_GREEN1_Pin , GPIO_PIN_SET);
21                  display7SEG(5-count);
22                  display7SEG1(3-count1);
23                  if(count1 >= 3 ){
24                      led_status = 1;
25                      count1 = 0;
26                  }
27                  if(count >= 5) count = 0;
28                  break;
29              case 1:
30                  HAL_GPIO_WritePin(LED_RED_GPIO_Port ,
31                     LED_RED_Pin , GPIO_PIN_SET);

```

```

25             HAL_GPIO_WritePin(LED_YELLOW_GPIO_Port ,
26             LED_YELLOW_Pin , GPIO_PIN_RESET);

70             LED_GREEN_Pin , GPIO_PIN_RESET);
71             HAL_GPIO_WritePin(LED_RED1_GPIO_Port ,
72             LED_RED1_Pin , GPIO_PIN_SET);
73             HAL_GPIO_WritePin(LED_YELLOW1_GPIO_Port ,

```

```

59     LED_YELLOW1_Pin, GPIO_PIN_RESET);
60             HAL_GPIO_WritePin(LED_GREEN1_GPIO_Port,
61             LED_GREEN1_Pin, GPIO_PIN_RESET);
62             display7SEG(2-count);
63             display7SEG1(5-count1);
64             if(count >= 2){
65                 led_status = 0;
66                 count = 0;
67             }
68             if(count1 >= 5) count1 = 0;
69             break;
70 }

```

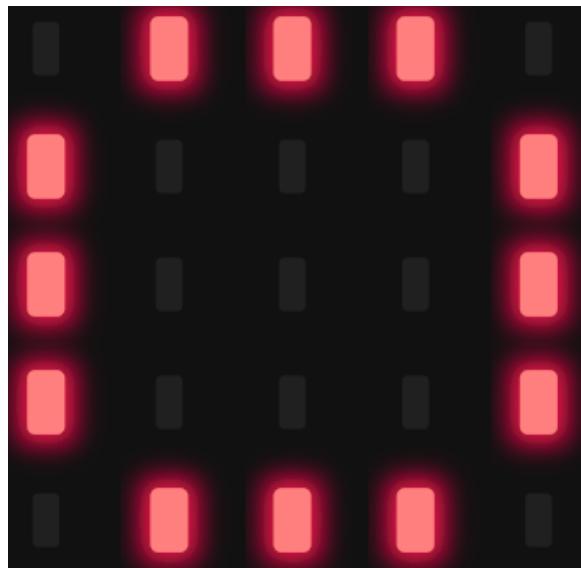

Hàm ex5_run() điều khiển trạng thái của 2 đèn LED và hiển thị thời gian trên 2 màn hình 7 đoạn, mỗi màn hình hiển thị một giá trị đếm ngược. Hàm sử dụng 2 biến đếm (count và count1) để thay đổi trạng thái của các đèn LED và giá trị hiển thị trên màn hình 7 đoạn. Cụ thể, hàm có các bước sau:

- Mỗi đèn LED có một trạng thái bật/tắt riêng biệt cho 2 đèn: LED_RED, LED_YELLOW, LED_GREEN (cho đèn 1) và LED_RED1, LED_YELLOW1, LED_GREEN1 (cho đèn 2).
- Hàm sử dụng các giá trị từ count và count1 để thay đổi giá trị hiển thị trên màn hình 7 đoạn qua các hàm display7SEG() và display7SEG1().
- Mỗi trạng thái của đèn LED có một thời gian hiển thị được điều chỉnh bằng cách kiểm tra các giá trị của count và count1.
- Sau mỗi khoảng thời gian, giá trị count và count1 sẽ được làm mới, và trạng thái của đèn LED sẽ thay đổi tuần tự qua 4 trạng thái, giúp tạo ra một chu kỳ hoạt động.

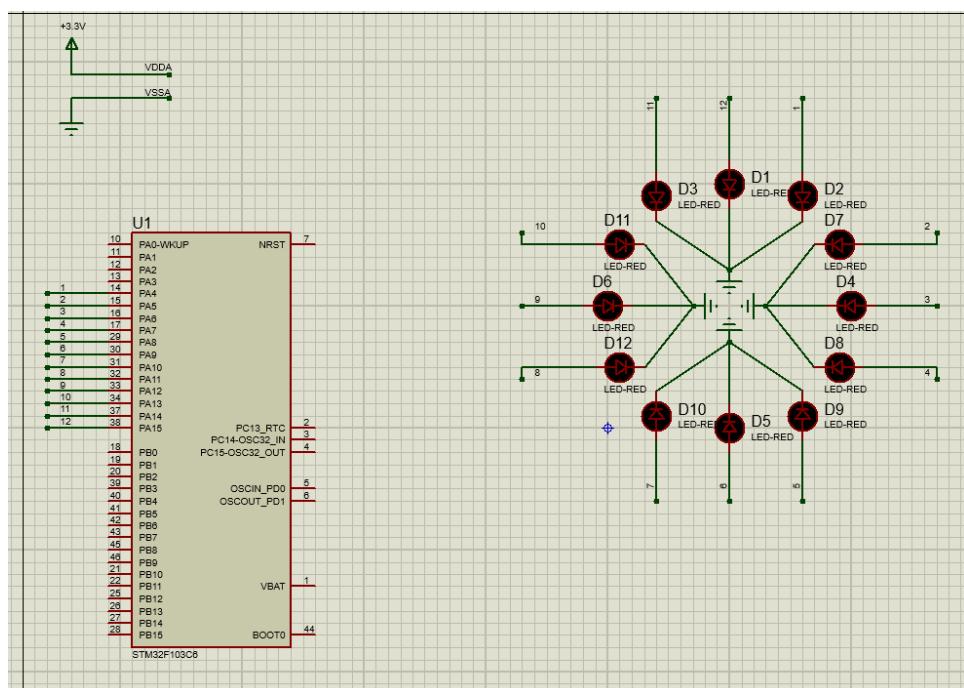

4.6 Exercise 6

In this exercise, a new Proteus schematic is designed to simulate an analog clock, with 12 different number. The connections for 12 LEDs are supposed from PA4 to PA15 of the STM32. The arrangement of 12 LEDs is depicted as follows.

Report 1: Present the schematic.

Hình 1.29: 12 LEDs for an analog clock

Hình 1.30: 12 LEDs for an analog clock

Report 2: Implement a simple program to test the connection of every single LED. This testing program should turn every LED in a sequence.

Source code Exercise 6

```
1     void ex6_run(void){  
2         static int status = 1;  
3         GPIO_TypeDef* LED_Ports[] = {LED_12_GPIO_Port,  
4                                         LED_1_GPIO_Port, LED_2_GPIO_Port, LED_3_GPIO_Port,  
5                                         LED_4_GPIO_Port,  
6                                         LED_5_GPIO_Port,  
7                                         LED_6_GPIO_Port, LED_7_GPIO_Port, LED_8_GPIO_Port,  
8                                         LED_9_GPIO_Port,  
9                                         LED_10_GPIO_Port, LED_11_GPIO_Port};  
10        uint16_t LED_Pins[] = {LED_12_Pin, LED_1_Pin, LED_2_Pin,  
11                               LED_3_Pin, LED_4_Pin,  
12                               LED_5_Pin, LED_6_Pin, LED_7_Pin,  
13                               LED_8_Pin,  
14                               LED_9_Pin, LED_10_Pin, LED_11_Pin  
15 };  
16  
17     for(int i = 0; i < 12; i++){  
18         HAL_GPIO_WritePin(LED_Ports[i], LED_Pins[i],  
19                             GPIO_PIN_RESET);  
20     }  
21  
22     HAL_GPIO_WritePin(LED_Ports[status - 1], LED_Pins[status  
23 - 1], GPIO_PIN_SET);  
24  
25     status++;  
26     if(status > 12) status = 1;  
27 }
```

Hàm ex6_run() điều khiển dây 12 đèn LED bằng cách tuần tự bật một đèn LED trong số 12 đèn. Cụ thể, hàm hoạt động như sau:

- LED_Ports []: Mảng các cổng GPIO chứa các đèn LED.
- LED_Pins []: Mảng các chân GPIO tương ứng với các đèn LED.
- Hàm bắt đầu bằng cách tắt tất cả các đèn LED, thiết lập trạng thái của tất cả các chân GPIO trong mảng LED_Pins [] thành GPIO_PIN_RESET.
- Sau đó, một đèn LED được bật, đèn LED có chỉ số status-1 sẽ được bật (tức là đèn LED đầu tiên được bật khi status = 1, đèn LED thứ hai khi status = 2, v.v.).
- Trạng thái status sẽ được tăng lên sau mỗi lần gọi hàm, và khi status vượt quá 12, nó sẽ quay lại giá trị 1.

4.7 Exercise 7

Implement a function named **clearAllClock()** to turn off all 12 LEDs. Present the source code of this function.

```
1 void clearAllClock(void){  
2     HAL_GPIO_WritePin(LED_1_GPIO_Port, LED_1_Pin,  
3     GPIO_PIN_RESET);  
4     HAL_GPIO_WritePin(LED_2_GPIO_Port, LED_2_Pin,  
5     GPIO_PIN_RESET);  
6     HAL_GPIO_WritePin(LED_3_GPIO_Port, LED_3_Pin,  
7     GPIO_PIN_RESET);  
8     HAL_GPIO_WritePin(LED_4_GPIO_Port, LED_4_Pin,  
9     GPIO_PIN_RESET);  
10    HAL_GPIO_WritePin(LED_5_GPIO_Port, LED_5_Pin,  
11    GPIO_PIN_RESET);  
12    HAL_GPIO_WritePin(LED_6_GPIO_Port, LED_6_Pin,  
13    GPIO_PIN_RESET);  
14    HAL_GPIO_WritePin(LED_7_GPIO_Port, LED_7_Pin,  
15    GPIO_PIN_RESET);  
16    HAL_GPIO_WritePin(LED_8_GPIO_Port, LED_8_Pin,  
17    GPIO_PIN_RESET);  
18    HAL_GPIO_WritePin(LED_9_GPIO_Port, LED_9_Pin,  
19    GPIO_PIN_RESET);  
20    HAL_GPIO_WritePin(LED_10_GPIO_Port, LED_10_Pin,  
21    GPIO_PIN_RESET);  
22    HAL_GPIO_WritePin(LED_11_GPIO_Port, LED_11_Pin,  
23    GPIO_PIN_RESET);  
24    HAL_GPIO_WritePin(LED_12_GPIO_Port, LED_12_Pin,  
25    GPIO_PIN_RESET);  
26}  
27}
```

Program 1.9: Function Implementation

4.8 Exercise 8

Implement a function named **setNumberOnClock(int num)**. The input for this function is from **0 to 11** and an appropriate LED is turn on. Present the source code of this function.

```
1     void setNumberOnClock(int num){  
2     GPIO_TypeDef* LED_Ports[] = {LED_12_GPIO_Port,  
3         LED_1_GPIO_Port, LED_2_GPIO_Port, LED_3_GPIO_Port,  
4         LED_4_GPIO_Port,  
5             LED_5_GPIO_Port,  
6         LED_6_GPIO_Port, LED_7_GPIO_Port, LED_8_GPIO_Port,  
7             LED_9_GPIO_Port,  
8         LED_10_GPIO_Port, LED_11_GPIO_Port};  
9 }
```

```

5     uint16_t LED_Pins[] = {LED_12_Pin, LED_1_Pin, LED_2_Pin,
6         LED_3_Pin, LED_4_Pin,
7             LED_5_Pin, LED_6_Pin, LED_7_Pin,
8             LED_8_Pin,
9                 LED_9_Pin, LED_10_Pin, LED_11_Pin
10    };
11 }

```

4.9 Exercise 9

Implement a function named **clearNumberOnClock(int num)**. The input for this function is from **0 to 11** and an appropriate LED is turn off.

```

1     void clearNumberOnClock(int num){
2     GPIO_TypeDef* LED_Ports[] = {LED_12_GPIO_Port,
3         LED_1_GPIO_Port, LED_2_GPIO_Port, LED_3_GPIO_Port,
4         LED_4_GPIO_Port,
5             LED_5_GPIO_Port,
6             LED_6_GPIO_Port, LED_7_GPIO_Port, LED_8_GPIO_Port,
7                 LED_9_GPIO_Port,
8                 LED_10_GPIO_Port, LED_11_GPIO_Port};
9     uint16_t LED_Pins[] = {LED_12_Pin, LED_1_Pin, LED_2_Pin,
10    LED_3_Pin, LED_4_Pin,
11        LED_5_Pin, LED_6_Pin, LED_7_Pin,
12        LED_8_Pin,
13            LED_9_Pin, LED_10_Pin, LED_11_Pin
14    };
15 }

```

4.10 Exercise 10

Integrate the whole system and use 12 LEDs to display a clock. At a given time, there are only 3 LEDs are turn on for hour, minute and second information.

Source code Exercise 10

```

1     void ex10_run(int *hour, int *minute, int *second) {
2         setNumberOnClock(*hour % 12);
3         setNumberOnClock(*minute / 5);
4         setNumberOnClock(*second / 5);
5
6         (*second)++;

```

```

7     if (*second >= 60) {
8         *second = 0;
9         (*minute)++;
10    }
11    if (*minute >= 60) {
12        *minute = 0;
13        (*hour)++;
14    }
15    if (*hour >= 12) {
16        *hour = 0;
17    }
18 }
19 }
```

```

1     int hour = 0;
2     int minute = 5;
3     int second = 0;
4
5     while (1)
6     {
7         ex10_run(&hour, &minute, &second);
8         HAL_Delay(500);
9         clearAllClock();
10        HAL_Delay(500);
11    }
```

Hàm ex10_run(int *hour, int *minute, int *second) thực hiện việc cập nhật thời gian của đồng hồ và hiển thị các giá trị lên các đồng hồ số. Cụ thể, hàm hoạt động như sau:

- setNumberOnClock(*hour % 12): Hiển thị giờ hiện tại trên đồng hồ, nhưng giờ chỉ giới hạn trong khoảng từ 0 đến 11 (chế độ 12 giờ).
- setNumberOnClock(*minute / 5): Hiển thị giá trị phút theo các bội số của 5 (0, 1, 2,..., 11).
- setNumberOnClock(*second / 5): Hiển thị giá trị giây theo các bội số của 5 (0, 1, 2,..., 11).
- (*second)++: Tăng giá trị giây mỗi lần hàm được gọi.
- Kiểm tra nếu giây (*second) đạt 60, đặt lại giá trị giây về 0 và tăng giá trị phút.
- Kiểm tra nếu phút (*minute) đạt 60, đặt lại giá trị phút về 0 và tăng giá trị giờ.
- Kiểm tra nếu giờ (*hour) đạt 12, đặt lại giá trị giờ về 0 (chế độ 12 giờ).
